

## Hybrid Cloud, Disaster Ready

Delivering efficient, cost-effective and tailored solutions.

- Cloud hosting services
- NetApp ONTAP powered storage solutions
- VMWare powered hypervisor solutions
- 24/7/365 support when you need it most
- Enterprise network integration

If over provisioning expenses, costly bandwidth fees, complex automation, end to end latency or data sovereignty concerns are plaguing your cloud adoption strategy, **Ampersand offers tailored solutions to help you avoid the pitfalls of cloud adoption and move your application portfolio forward.**

In partnering with MTA Fiber Holdings and the AlcanONE network, **Ampersand is uniquely positioned to deliver industry-leading connectivity and game-changing hybrid cloud capabilities for medium and enterprise businesses.**

## Avoid Cloud Pitfalls

Your applications and technology rely on solid infrastructure. While hyperscale cloud solutions offer flexibility, they're often rife with hidden costs and overage fees which can materially impact your operating budget.

At Ampersand, we believe that adopting Cloud solutions does not have to involve complex cost calculations or exploitative “egress data fees”. Instead, we offer a reliable cloud infrastructure solution, robust connectivity options and a simple model. You should have the confidence of knowing that your cloud adoption strategy is delivering true business value.

## Future in digital transformation

Digital transformation requires that Information Technology departments embed themselves within every facet of business operation, developing a deep understanding and empathy for how best to serve and advise their organization as a whole.

If your organization spends time talking about hardware warranties, data storage footprints, quantities of server instances, software patching cycles and what caused the last service outage, you are missing out.

Instead, your technology Subject Matter Experts should be discussing how business process will become more efficient, service delivery more exceptional and data more actionable, all while having the confidence of knowing that a qualified service delivery organization is providing the robust hybrid cloud infrastructure they need to be successful.

## Harness the power of human connection

Every technology organization knows that tremendous time, effort, and money go into simply “keeping the lights on” when it comes to Information Technology. Whether it is dealing with hardware and application lifecycle, staying ahead of security threats, or providing world class technology support, these are all vital functions of a well-executed technology sustainment plan.

However, in today’s competitive business market, often it is not enough to simply hold and maintain. Unleash the power of human connection by partnering your traditional Information Technology teams with the rest of your organization to foster innovation throughout.

Your Information Technology team should be able to focus on delivering business outcomes while also delivering world-class technology sustainment.
